

Take-Home Assignment - Sr. Growth Analyst

Scenario:

You've just joined deskbird as the Sr. Growth Analyst. The Growth team needs a reliable set of metrics and data models to understand the end-to-end customer journey. You are provided fictional raw datasets:

- **Paid ads data** (impressions, clicks, spend, conversions)
- **CRM pipeline** (leads, opportunities, closed won/lost)
- **Product usage events** (logins, seat utilization, feature adoption)

Your task:

1. Design a high-level **data model** (e.g., schema diagram, dbt DAG sketch, or clear table relationships) that connects these datasets in a scalable way.
2. Define **5 key growth metrics** that you would track to measure acquisition, conversion, and retention.
3. Use the fictional dataset to surface **exploratory insights** that could help shape deskbird's Growth strategy.
4. Present your work in a slide deck, showing how your model and metrics enable actionable insights.

Expected output:

- 6–10 pages long slide deck including:
 - Data model diagram
 - Defined metrics with rationale
 - Exploratory insights with visualization(s)
 - Recommendations
- Codebase in Python (e.g. ipynb files), SQL or others showing how you came to your findings.

Tips:

- Aim for clarity and stakeholder-readability in your slides.
- You do not need to cover every single column, focus on what's most impactful.
- Feel free to aggregate or manipulate data as you see fit
- Focus on reproducibility
